Identifier	PGN	PGN label	Tmin	Tmax	Default Priority	Message Type	DPext	DP	Group Extension	Source	Destination	Standard/ proprietary
18FF00FE	0x0FF00	EM5P1_BB_requests_1	100	100	6	Cyclic	0	0	00	0xFE		Prop

CAN messages used by bodywork ECU(s) to setup parameters and control requests via the BICT file to the EM5P1 ECU (IQAN). To be used by bodybuilders that uses *External bodywork CAN bus!*

Pump_max_speed: Max speed which the hydraulic pump can handle OR if the flow in the system needs to be maximized for whatever reason. (3800 rpm is Max available speed)

Pump_max_torque: Max torque (pressure) which the hydraulic pump can handle OR if the flow in the system needs to be maximized for whatever reason. (530Nm is electric motor limit).

Mode_Pressure/Speed/eLS: Which mode that is used for the ePTO system.

Pump_rot_direction: Which rotation direction the pump will spin. Clockwise/counterclockwise is hydraulic pump rotation direction (electric motor will rotate opposite direction!)

Every value in parameter outside of "operating range" will result in an error and electric motor will stop its operation.

* “Dimensionless” in the CAN message

18FF01FE	0x0FF01	EM5P1_BB_requests_2	100	100	6	Cyclic	0	0	01	0xFE		Prop

CAN messages used by bodywork ECU(s) to setup parameters and control requests via the BICT file to the EM5P1 ECU (IQAN). To be used by bodybuilders that uses *External bodywork CAN bus!*

Pump_speed_slope: Maximal rpm change that the hydraulic pump can handle, in rpm/100ms. 1000 in this parameter means rpm change of 10'000 rpm per second. Hydraulic pump information is needed for this parameter.

Pump_torque_slope: Maximal torque change that the hydraulic pump can handle, in Nm/100ms. 50 in this parameter means a change of 500 Nm per second on the electric motor. Hydraulic pump information is needed for this parameter.

Pump_size: This parameter is the hydraulic pump size in mm3. A value of 250'000 means a pump size of 250cm³

Delta_pressure_eLS: This is the desired differential pressure in a Load Sensing system (eLS)

Every value in parameter outside of "operating range" will result in an error and electric motor will stop its operation.

E_mach._spd_governor: Electrical machine speed governor that is used by the EM5P1 speed manager to adjust the speed loop when the speed command changes upwards or downwards. This parameter is valid when “Mode_speed” is used. Important! If this parameter varies for different stages of the bodywork control, must only be changed when Oil Request is FALSE.

- Parameter Set: In this mode the electrical machine will adjust to target speed according to own preferences. Contact SCANIA for further information
- Slow: the electrical machine is adjusting the new target speed at the slowest possible rate. To be used when the speed command change is done without load!
- Medium: the electrical machine is adjusting the new target speed at a slower rate. To be used when the speed command change is not inducing any oscillations with the load change! If the electrical machine experience any oscillations set the parameter to Slow if needed.
- Fast: the electrical machine is adjusting the new target speed as fast as possible. To be used when the speed command change is not inducing any oscillations with the load change! If the electrical machine experience any oscillations set the parameter to Medium level or even Slow if needed.

Every value in parameter outside of “operating range” will result in an error and electric motor will stop its operation.

CAN messages used by bodywork ECU(s) to setup parameters and control requests via the BICT file to the EM5P1 ECU (IQAN). To be used by bodybuilders that uses *External bodywork CAN bus!*

Speed_cmd: Desired speed of the hydraulic pump when running in "Speed mode". The speed command should NOT be higher than the hydraulic system or hydraulic pump can withstand. Every command outside of "operating range" will result in an error and electric motor will seize of operation.

Torque_cmd: Desired torque (pressure) of the hydraulic pump when running in "Torque mode". The torque (pressure) command should NOT be higher than the hydraulic system or hydraulic pump can withstand. Every command outside of "operating range" will result in an error and electric motor will seize of operation.

Request_oil: When this parameter is active ("1"), the electrical machine will be activated in commanded mode and requested speed/torque or start the eLS function.

CAN messages used by bodywork ECU(s) to receive EM5P1 feedback signal via the BICT file from the EM5P1 ECU (IQAN). To be used by bodybuilders that uses *External bodywork CAN bus!*

Actual_Motor_Temp: Feedback from electric motor of real measured actual temperatures in the windings.
Max allowed temperature is 150 degrees, derating starts at 140 degrees.

Actual_Inverter_Temp: Feedback from Inverter of real measured actual temperatures on the Heatsink inside the inverter. Max allowed temperature is 85 degrees, derating starts at 65 degrees.

EM5P1_power_budget: Feedback signal calculated by the EM5P1 that shows a dynamic power value based on the total available value minus the used value. The value takes in account the heat temperature degradation!

EM5P1_torque_budget: Feedback signal calculated by the EM5P1 that shows a dynamic torque value based on the total available value minus the used value. The value takes in account the heat temperature degradation!
